Chromosomal Aberrations In Multiple Myeloma Drive Oncogene Expression

The MMSET Protein Contains Domains Involved In Chromatin Function

 **SET** = **S**uvar, **E**nhancer-of-Zeste and **T**rithorax domain; catalyzes lysine methylation in histones and transcription factors.

 **HMG** = **H**igh **M**obility **G**roup; Possible DNA binding domain.

 **PWWP** = Pro-Trp-Trp-Pro; found in nuclear proteins.

 **PHD** = **P**lant **H**omeo**D**omain; methyl-lysine binding module.

 **NLS** = **N**uclear **L**ocalization **S**equence

Histone Lysine Modifications

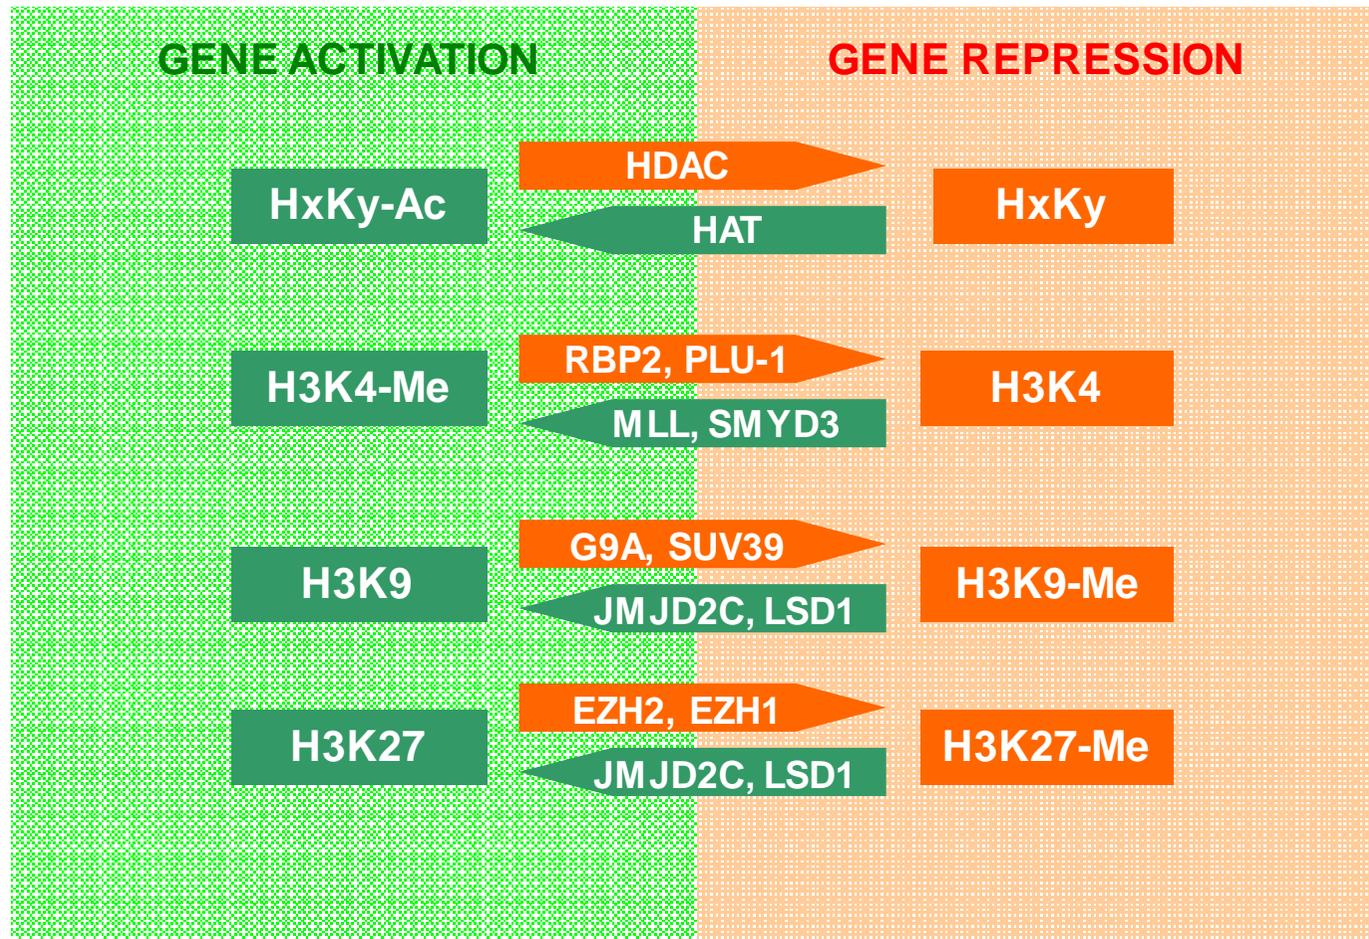

Lysines are the most diversely modified residues in histones.

Histone Modifications are “Read” By Specific Modules

Different Chromatin Modifications and Enzymes Are Associated With Alternative Transcriptional Outcomes

MMSET Inhibitor Screen Summary

- 10,000 compounds screened in pools of 8
 - 5 uM MMSET, 2 uM peptide, 1 mM SAM, 12.5 uM each compound
- Total of 11 pools with significant inhibition (20-30%)
- Deconvoluted 11 pooled hits to singletons (Data below)
 - 6 compounds with >40% inhibition at 10 uM

Conclusions

- MMSET Appears to be a Therapeutic Target in Myeloma
- MMSET Inhibitors exist and more will be developed
 - The HMT Activity of MMSET is Important for Biological Effects
- MMSET Can Activate and Repress Genes
 - Exact Critical Targets being determined
- MMSET May Have Effects on other Chromatin-Dependent Processes
 - DNA Repair
 - DNA replication?
- MMSET Myeloma May Have Specific “Achilles Heels”
